Please note, line breaks were added for readability, and are **not** part of the original message

## Question 4

Calculations done by code, showing intermediate steps exactly as output from RSA.py

$$17^{54} \bmod 139 = 125$$

$$17^1 = 17 \bmod 139$$

$$17^2 = 11 \bmod 139$$

$$17^4 = 121 \bmod 139$$

$$17^8 = 46 \bmod 139$$

$$17^{16} = 31 \bmod 139$$

$$17^{32} = 127 \bmod 139$$

Starting with  $17^{32} \bmod 139$

Multiplying by  $17^{16}$ , to reach  $17^{48} \bmod 139$

Multiplying by  $17^4$ , to reach  $17^{52} \bmod 139$

Multiplying by  $17^2$ , to reach  $17^{54} \bmod 139$

Calculated  $17^{54} \bmod 139 = 125$

$$2345^{65531} \bmod 265189 = \mathbf{32548}$$

$$2345^1 = 2345 \bmod 265189$$

$$2345^2 = 195245 \bmod 265189$$

$$2345^4 = 221653 \bmod 265189$$

$$2345^8 = 77513 \bmod 265189$$

$$2345^{16} = 143185 \bmod 265189$$

$$2345^{32} = 182635 \bmod 265189$$

$$2345^{64} = 70805 \bmod 265189$$

$$2345^{128} = 215169 \bmod 265189$$

$$2345^{256} = 207374 \bmod 265189$$

$$2345^{512} = 132069 \bmod 265189$$

$$2345^{1024} = 209853 \bmod 265189$$

$$2345^{2048} = 200702 \bmod 265189$$

$$2345^{4096} = 144460 \bmod 265189$$

$$2345^{8192} = 173623 \bmod 265189$$

$$2345^{16384} = 116932 \bmod 265189$$

$$2345^{32768} = 212973 \bmod 265189$$

Starting with  $2345^{32768} \bmod 265189$

Multiplying by  $2345^{16384}$ , to reach  $2345^{49152} \bmod 265189$

Multiplying by  $2345^{8192}$ , to reach  $2345^{57344} \bmod 265189$

Multiplying by  $2345^{4096}$ , to reach  $2345^{61440} \bmod 265189$

Multiplying by  $2345^{2048}$ , to reach  $2345^{63488} \bmod 265189$

Multiplying by  $2345^{1024}$ , to reach  $2345^{64512} \bmod 265189$

Multiplying by  $2345^{512}$ , to reach  $2345^{65024} \bmod 265189$

Multiplying by  $2345^{256}$ , to reach  $2345^{65280} \bmod 265189$

Multiplying by  $2345^{128}$ , to reach  $2345^{65408} \bmod 265189$

Multiplying by  $2345^{64}$ , to reach  $2345^{65472} \bmod 265189$

Multiplying by  $2345^{32}$ , to reach  $2345^{65504} \bmod 265189$

Multiplying by  $2345^{16}$ , to reach  $2345^{65520} \bmod 265189$

Multiplying by  $2345^8$ , to reach  $2345^{65528} \bmod 265189$

Multiplying by  $2345^2$ , to reach  $2345^{65530} \bmod 265189$

Multiplying by  $2345^1$ , to reach  $2345^{65531} \bmod 265189$   
 Calculated  $2345^{65531} \bmod 265189 = 32548$

$$4733459^{65537} \bmod 75968647 = \mathbf{621879}$$

$4733459^1 = 4733459 \bmod 75968647$   
 $4733459^2 = 49107677 \bmod 75968647$   
 $4733459^4 = 16238929 \bmod 75968647$   
 $4733459^8 = 67757406 \bmod 75968647$   
 $4733459^{16} = 25488171 \bmod 75968647$   
 $4733459^{32} = 64480977 \bmod 75968647$   
 $4733459^{64} = 57889554 \bmod 75968647$   
 $4733459^{128} = 19358089 \bmod 75968647$   
 $4733459^{256} = 50744319 \bmod 75968647$   
 $4733459^{512} = 56497489 \bmod 75968647$   
 $4733459^{1024} = 54825938 \bmod 75968647$   
 $4733459^{2048} = 38930457 \bmod 75968647$   
 $4733459^{4096} = 49024383 \bmod 75968647$   
 $4733459^{8192} = 51007254 \bmod 75968647$   
 $4733459^{16384} = 24313 \bmod 75968647$   
 $4733459^{32768} = 59341440 \bmod 75968647$   
 $4733459^{65536} = 51988154 \bmod 75968647$

Starting with  $4733459^{65536} \bmod 75968647$   
 Multiplying by  $4733459^1$ , to reach  $4733459^{65537} \bmod 75968647$   
 Calculated  $4733459^{65537} \bmod 75968647 = 621879$

## Question 5

You wish to securely send the message  $M=654733$  to the bank

**i) State the calculation to encrypt this message for sending to the bank**

$$C = M^{e_{bank}} \bmod n_{bank}$$

In this case,  
 $C = 654733^{65537} \bmod 76282747$

ii) State the encrypted value, calculated using your code

39964485

## Question 6

The bank sends you an encrypted message 1684446

i) State the calculation used in decryption

$$C^{d_{mine}} = M^{e_{mine} d_{mine}} = M \bmod n_{mine}$$

In this case,

$$C^{3497603} = M^{1676267 \cdot 3497603} = M \bmod 9436709$$

ii) What is the decrypted value in this case?

1101011

## Question 7

The bank requests a signed encrypted message from you so that they can verify that you are the sender and the message is secure in transmission to them. You should encrypt the message and signature as two separate blocks. They already know your public key.

i) State the calculation to sign and encrypt the message  
**337722**

Sign the message

$$S = M^{d_{mine}} \bmod n_{mine}$$

Encrypt the message

$$C_M = M^{e_{bank}} \bmod n_{bank}$$

Encrypt the signature

$$C_S = S^{e_{bank}} \bmod n_{bank}$$

In this case,

$$S = 337722^{3497603} \bmod 9436709$$

Encrypt the message

$$C_M = 337722^{65537} \bmod 76282747$$

Encrypt the signature

$$C_S = S^{65537} \bmod 76282747$$

**ii) What is the transmission made for the message 337722 when it has been signed and encrypted?**

Intermediate step, signing the message

$$S = 7218665$$

Actual transmission made below

$$C(S) = 59821766$$

$$C(M) = 33191197$$

## Question 8

They return the following signed and encrypted message to you:

$$(C(M), C(S)) = (4647068, 526345)$$

**i) State the calculations required to decrypt and verify the message**

To decrypt the message

$$C(M)^{d_{mine}} = M^{e_{mine} d_{mine}} = M \bmod n_{mine}$$

To decrypt the signature

$$C(S)^{d_{mine}} = S^{e_{mine} d_{mine}} = S \bmod n_{mine}$$

To 'un-sign' the signature (retrieve the message)

$$M_2 = S^{e_{bank}} \bmod n_{bank}$$

In this case,

To decrypt the message

$$4647068^{3497603} = M^{1676267 \cdot 3497603} = M \text{ mod } 9436709$$

To decrypt the signature

$$526345^{3497603} = S^{1676267 \cdot 3497603} = S \text{ mod } 9436709$$

To 'un-sign' the signature (retrieve the message)

$$M_2 = S^{65537} \text{ mod } 76282747$$

## ii) State the values in this case

Decrypted M = 7406060

Decrypted S = 8180219

'Un-signed' S = 64026314

## iii) State whether the signature is valid or not

It is not valid, as it does not match the decrypted M.

## Question 9

You wish to demonstrate to the bank that you know a third party (Bob), by showing a signed message that appears to come from Bob. Bobs public key is (122269479, 53407), but you do not know his private key. Construct a valid signed message from Bob, and show that the check calculations confirm that signature is valid.

Chosen signature = 54321246

Calculated message = 36464280

We check that the chosen signature is valid for this message by 'un-signing' it, using Bob's public key, to retrieve the message it represents. (If we had access to Bob's private key, we could also verify by signing the message.)

Verify  $M = S^{e_{bob}} \text{ mod } n_{bob}$

$$\text{Verify } 36464280 = 54321246^{53407} \text{ mod } 122269479$$

The steps carried out to verify this result are shown below

$$54321246^1 = 54321246 \text{ mod } 122269479$$

$$54321246^2 = 81646755 \text{ mod } 122269479$$

```

54321246^4 = 83557920 mod 122269479
54321246^8 = 57369570 mod 122269479
54321246^16 = 119457924 mod 122269479
54321246^32 = 119700675 mod 122269479
54321246^64 = 114747744 mod 122269479
54321246^128 = 86356824 mod 122269479
54321246^256 = 27923511 mod 122269479
54321246^512 = 95156322 mod 122269479
54321246^1024 = 48525369 mod 122269479
54321246^2048 = 81219015 mod 122269479
54321246^4096 = 15183681 mod 122269479
54321246^8192 = 53006622 mod 122269479
54321246^16384 = 90264669 mod 122269479
54321246^32768 = 71323281 mod 122269479

```

```

Starting with 54321246^32768 mod 122269479
Multiplying by 54321246^16384, to reach 54321246^49152 mod 122269479
Multiplying by 54321246^4096, to reach 54321246^53248 mod 122269479
Multiplying by 54321246^128, to reach 54321246^53376 mod 122269479
Multiplying by 54321246^16, to reach 54321246^53392 mod 122269479
Multiplying by 54321246^8, to reach 54321246^53400 mod 122269479
Multiplying by 54321246^4, to reach 54321246^53404 mod 122269479
Multiplying by 54321246^2, to reach 54321246^53406 mod 122269479
Multiplying by 54321246^1, to reach 54321246^53407 mod 122269479
Signature 54321246 found to represent message: 36464280

```

## Question 10

You intercept a message from Bob to the bank, which says: My new 3-digit PIN code is in the encrypted attachment. Yours Bob. and comes with the attachment (58621765). How can you crack such a message and what is Bobs new PIN?

Being only three digits, there are only 1000 possible PINs. As we know the Bank's public key, we can brute force values 000, 001, ..., 999, encrypting each of them with the Bank's public key, until one of them matches 58621765, at which point we have found Bob's new PIN.

```
Bob's new pin = 777
```
